This study will recruit and characterize couples who have been unsuccessful in their first attempt at infertility treatment and investigate genetic and immunological factors that correlate with subsequent success.

Detailed Description Infertility is a very common problem that affects one in six couples. Although it is often associated with health conditions such as female ovarian insufficiency, tubal occlusion, and male factor infertility, it is estimated that over 50% of infertility is unexplained. The percentage of female and male infertility that is unexplained is even greater. The use of a spectrum of fertility treatments, such as in vitro fertilization (IVF) and adoption, has become commonplace in infertile couples. This study will identify couples who have been unsuccessful in their first attempt at IVF and will describe the demographic, medical, and health factors that may play a role in their subsequent success. Secondly, because the study is ongoing, it will examine the effects of potential treatments for women with ovarian insufficiency to optimize reproductive success. The study will be conducted at the University of Iowa in the Department of Obstetrics, Gynecology and Reproductive Sciences. Subjects will have been enrolled in the clinic's 'watchful waiting' program, where patient and partner have been observed for at least one year without any attempts at fertility treatments. This time period is typically used as a 'sham treatment' to determine the effects of a fertile population. Women with ovarian insufficiency, women on high-dose estrogen, and men with spermatologic anomalies are excluded. Couples will be excluded if one or both partners have suffered a systemic illness, and if the female partner is currently using a form of hormone therapy to achieve pregnancy. The population of study will consist of couples in which the woman is older than 35 years, and has been diagnosed with unexplained infertility (average age 40 years) who have been 'watchful waiting' for an average of 6 years. Further study details as provided by Iowa Health and Human Services, University of Iowa:
